

# Credit and billing module

For all institutions that need to charge for printing

All educational institutions have one thing in common – the thousands of students and members of the staff that need to use the printers. This module brings you an effective solution for charging for all printing operations and convenient access to print for students and staff.

How Credit and billing will simplify your life

## Administrator

- Based on the requirements of the organization, I can set up different prices for printing and copying, as well as different credit levels, including the possibility of regular recharging.
- If necessary, YSoft Payment System can be connected with the applications of third parties.

## User

- Anything I need for my studies or even privately I can print at any time without any problems directly at school or in the library. I cannot just print, but also manage my account and credit without the help of others.
- I can recharge credit on the system in many ways:
  - inserting it into the self-service machine for coins and banknotes
  - at the service desk , where I can pay in cash or by card
  - via PayPal or through another supported payment gateway directly from a computer

## Credit and billing module properties

- The possibility of charging for printing, copying and scanning services within the entire organization
- Direct print queue – direct printing at a predefined printer without the need of user authorization
- YSoft Payment System solution including the administration and the cashier interface
- Support of the YSoft SafeQ Payment Machine for self-service credit recharging
- The possibility to define several different price lists
- Support of multi-level project billing

## Company manager

- We gave the students a helping hand in the way that we made print available directly at school premises. We have the costs associated with printing completely under control, even as a big institution with dozens of users of the print environment.
- We have the possibility to charge different print prices for different printers, cost centers or even for individual users. It can be easily defined that selected users (e.g. teachers, staff) print for free. At the same time, we can set such a price list that we cover the teachers' printing from money earned.
- The students use their usual card after logging into the printer (e.g. ISIC), to which they also recharge the credit. So we did not have to deal with any additional costs for purchasing cards.
- With YSoft Payment Machine, a self-service machine to insert money into the system, we will save the cost of another employee that would otherwise have put money on credit accounts manually.
- Non-service credit recharging to the accounts may be carried out without cash – through a payment gateway (e.g. PayPal) or other similar systems.
- We have an overview of all user transactions thanks to YSoft Payment System. The system also allows us to do regular final accounts for each cash box within YSoft SafeQ and the accounting of the cash box.

## Recommended combination with other modules

### + the Authentication module – the possibility also to bill copies and scans

If your institution has multifunction machines, you will probably want to charge, in addition to print, for copying also. The completion of Credit and billing module with the Authentication module will allow you to do that. Thanks to this, the multi-functional device will be unlocked to the user after login and the system knows to whom to charge the copies (also possibly scans).

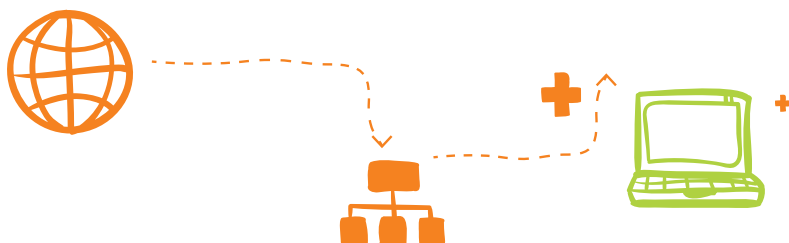

### + the Reporting module – for companies that bill printing on projects

Does your company work on the basis of projects? If, like law or engineering offices, you need to keep track of how much money you have spent on printing within different orders for different clients, use the combination of the Credit and billing module with Reporting module. You get an automated register of individual print operations and you will ease the process of re-invoicing.

The administrator sets the accounting codes centrally across all devices and users and can create an arbitrarily complex tree exactly according to the needs of your organization.

### + the Print Roaming module – secured printed documents

If you are considering purchasing the Credit and billing module for your institution for full use of all its features, we highly recommend a combination with the Print Roaming module. You will allow users to print in secured queue mode (the job is printed to the printer after login) and this way you protect their sensitive data. The system charging for the print according to a defined price list also applies. In addition, you will get other benefits that the Authentication module carries – we always deliver a Print Roaming module with an Authentication module.
