

Print Roaming Module

Get perfect security of access to sensitive documents

Must be ordered in combination with the Authentication module at least

A greater degree of user freedom, more efficient print processes and reliable security of sensitive data. You will really see the difference with Print Roaming! You can pick up the job sent to print on any machine, and even within a network of branches globally. In addition, the document is printed directly to your hands after logging into the printer, so you do not have to worry about its misuse.

How Print Roaming will simplify your life

Administrator

- Print Roaming provides a more accessible print environment for users – if a device is broken, the user can easily use any other in the system. Its work is not limited and I have space to solve the problem with the broken printer.
- More effective management of print queues and drivers makes my work easier – I install only one print queue instead of installing all printers for each user.
- I can easily optimize the use of the print environment in relation to the place from where the user prints – e.g. always print via the nearest server.
- I can also secure printing from server applications that do not print under the identity of a specific user. I simply direct the prints to a shared queue and any authorized user can pick them up. You can then identify who it was. In the case that the owner of the job is known, I can pair the user name from the application with a user account from Active Directory, and so on.

Print Roaming module properties

- ✓ The option to print through three types of print queue brings various print features:
 - direct print queues – direct printing to a predefined printer without the need of user authorization
 - secured print queues – the system prints the job after users log into the printer, the user can select any printer within the network
 - (VIP) shared queues – allow the sharing of print jobs among more users. Typically a manager may share the document to print with his assistant.
- ✓ Management of print jobs – users have control over their jobs even after sending them to print. They may choose directly on the terminal of a multifunction machine which jobs will print, browse those already printed, or add them to favorites.
- ✓ The ability to pick up the print job at any printer within a network of all branches globally

Company manager

- By the fact that you allow employees to pick up documents sent to print on any printer within the network, you will not only increase the comfort of their work, but you will positively affect their effectiveness at the same time.
- It often happens that a person sends a document to print and then forgets about it or does not need it any longer, etc. because a new version was created in the meantime. Your company will save money with Print Roaming because unclaimed tasks will not print themselves. In addition, it cannot happen to us that documents with sensitive information stay lying unclaimed at the printer.
- Our managers or employees do not know geographical restrictions thanks to Print Roaming. If they are going on a business trip to our branch at the other end of the world, they can pick up documents without any problems at the printer at the final destination. The same identification card is enough to log in, and for printing, the same driver that they already have installed from the home branch is enough.
- Documents printed in our company are safe. A copy does not lie at the printer, where anyone can take it, and if we find unauthorized printing, we can track it back to who did it and what they printed.
- The shared queue allows me to share documents for printing with my assistant, who prints them afterwards. So I have about one worry less and I save some time.

User

- I have the certainty that my data are safe with Print Roaming. The document is printed for me directly "to my hand" after logging into the machine. So no unauthorized person will get it.
- I can pick up the document sent to print at any printer within the company network without need of specifying it in advance. I simply go to the printer that works best for me (e.g. the closest), log in with the card or PIN and the system prints the job for me. If my favorite printer is busy or out of order, I just go to another one and pick up the document there. Easy, fast, convenient!
- I can gradually send multiple documents to print and pick them up at the same time when I go by the printer.
- The documents I print regularly, I save on the terminal of the printer to the favorites section, and so I have them available directly in the system at anytime.
- I can select directly on the printer, from a list of prepared documents, the tasks that I need to print at that moment, or delete the unnecessary ones. I can even see a preview of the first page of the document before printing.
- When I travel between branches, I can print the document from a different location than from where I sent it to print. For example, if I need to have extensive material prepared for a meeting, I do not have to transfer it anywhere and I print it on the spot. It is easy and really convenient.

Recommended combination with other modules

+ the Reporting module – a perfect overview about the use of printing and copying

If you want to have perfect control of all operations in your print environment, get the Reporting module as well. You will easily find out who, when and where printed, scanned, or copied within the context of detailed reports. In the case of prints and scans (with the Scan Management module), you will even find the specific document. This will get you a precise basis for possible optimization as well as better protection for sensitive company data.

If you are working on the basis of projects and need to keep track of how much money you spent on printing within different orders for different clients, in addition to the Reporting module, also use the Credit and billing module.

+ the Mobile Print module – the maximum degree of printing freedom

Move printing freedom even further. This combination with the Mobile Print module allows you to send the job to print literally from anywhere – from any means of transport, the waiting room at the doctor or from home. You are not dependent on a computer or a connection to the local network, you only need a smart phone or tablet with a mobile connection to the Internet.
